Codebook - The Dark Triad and attractiveness in speed dating

Contents

Here, we're just setting a few options.

```
knitr::opts_chunk$set(
  warning = TRUE, # show warnings during codebook generation
  message = TRUE, # show messages during codebook generation
  error = TRUE, # do not interrupt codebook generation in case of errors,
                # usually better for debugging
  echo = TRUE   # show R code
)
ggplot2::theme_set(ggplot2::theme_bw())
```

Now, we're preparing our data for the codebook.

```
library(codebook)
codebook_data <- codebook::bfi
# to import an SPSS file from the same folder uncomment and edit the line below
# codebook_data <- rio::import("mydata.sav")
```

```
# for Stata
# codebook_data <- rio::import("mydata.dta")
# for CSV
# codebook_data <- rio::import("mydata.csv")

# omit the following lines, if your missing values are already properly labelled
codebook_data <- detect_missing(codebook_data,
    only_labelled = TRUE, # only labelled values are autodetected as
                              # missing
    negative_values_are_missing = FALSE, # negative values are missing values
    ninety_nine_problems = TRUE,   # 99/999 are missing values, if they
                                     # are more than 5 MAD from the median

    )

# If you are not using formr, the codebook package needs to guess which items
# form a scale. The following line finds item aggregates with names like this:
# scale = scale_1 + scale_2R + scale_3R
# identifying these aggregates allows the codebook function to
# automatically compute reliabilities.
# However, it will not reverse items automatically.
codebook_data <- detect_scales(codebook_data)
```

4 BFIK_open items connected to scale

4 BFIK_agree items connected to scale

4 BFIK_extra items connected to scale

3 BFIK_neuro items connected to scale

4 BFIK_consc items connected to scale

Create codebook

```
# source: https://osf.io/jvk3u/
df <- rio::import("DarkTriadDate_person.sav")

# create codebook
codebook::codebook(df)
```

Metadata

Description   Dataset name: df

The dataset has N=90 rows and 60 columns. 45 rows have no missing values on any column.
